

Contactless/NFC Training

NFC (Near Field Communication), is a technology that allows for information exchange between portable, handheld devices. NFC is often referred to as the technology allowing the use of mobile phones for financial, ticketing, or identification transactions. With NFC, you will be able to offer faster and more convenient transactions to your customers using their own mobile phone.

The Collis Training Academy provides a training course specifically targeted at those wanting to know more about NFC, the NFC ecosystem, business models, technology, and deployment and operation of NFC services. This training is beneficial for employees of financial institutions, public transport operators, handset and terminal manufacturers, mobile network operators and others. Contact Collis to find out more today!

EMV Card Simulator

Collis' EMV Card Simulator simulates the real behaviour of an EMV card without the need for any physical EMV cards. The EMV Card Simulator can be used during development and testing of terminals (ATM, POS) prior to delivery to the host network and for certification. Testing of terminals against only one EMV card configuration is not enough to ensure it is EMV compliant. The EMV Card Simulator is the most advanced card simulator in the market to simulate the behaviour of any contact EMV card for complete and thorough testing. Use Collis' EMV Card Simulator to minimise risk by testing terminals before certification and reduce time to market!

Contactless/NFC Personalisation Validation Tool

More and more issuers of payment cards are at the stage of issuing Contactless cards. As Collis we are on top of the latest developments in the market space and we are capable of providing you with state-of-the-art testing tools for both contact and contactless payment cards. These latest developments also involve NFC. Collis' Contactless/NFC Personalisation Validation Tool (NFC PVT) tests the correct personalisation of all types of contactless cards and NFC devices.

The NFC PVT validates the content of NFC-enabled mobile phones. It checks the correctness of OTA (Over The Air) personalisation process. It can be used for any type of SE (Secure Element) and for any SE location. The NFC PVT has an OTA-inputfile tester. It tests the input of the OTA process independently of chosen network, network operator, handset manufacturer etc. Contact Collis for more information or advice on how to test your NFC device.

New Releases from Aspects Tools

Aspects Tools release 6.1.0 ships from mid-October. This release introduces new features requested by our customers. To aid debugging, filtering on 3G phonebook and file system has been added to the advanced search feature in PowerMonitor. Filter for commands related to selecting, reading or updating.

Aspects are proud to introduce a graphical editor to Aspects Card Profiler. This easy to use tool ensures the validity of any profile as it is written, reducing the time required to build, verify and test profiles. To improve data sharing, PowerScript allows users to automatically save test certificates as EVF files which can be opened in the free Aspects Viewer.

e-Ticketing Transaction Generator

Successful testing of an e-Ticketing system is crucial. To ensure detailed testing, Collis has developed a testing tool especially aimed for the benefit of companies in the public transportation industry who use an e-Ticketing system. Collis' e-Ticketing Transaction Generator is the most comprehensive, customisable testing tool for e-Ticketing systems available in the market today. This testing tool is the first of its kind available in the market. The e-Ticketing Transaction Generator locates possible failures in your e-Ticketing system. It ensures that your e-Ticketing system is working properly, even under pressure from a high capacity of transactions, or when confronted with errors. By gaining knowledge of the transaction capacity, your customers are not confronted with system failures or shut downs.

e-Ticketing Made Easy!

Load & Performance Testing

Banks world-wide are currently in the process of upgrading their IT-infrastructures and business processes to comply with EMV chip specifications. Collis has developed a unique EMV load and performance framework that allows card issuing banks to test the performance of their online real-time authorisation system. The online authorisation of purchases with an EMV payment card requires more processing power than is the case today with magstripe cards.

In order to avoid bottlenecks at peak-hour, Collis' EMV load and performance framework will tell you exactly if your systems are powerful enough to handle the number of EMV cards that you are planning to issue. The EMV load and performance framework is built on top of the Collis Conclusion test engine, the reliable and proven test engine that is being used by bankers all over the world! Contact Collis for more information.
